

Master in Environmental Bioengineering

Focus Professional

Engineering and environmental sciences represent more than 90% of the first year of the master. This fraction is reduced to 60% in the second year to give way to other axes added to complete the overall technical training: socio-economic, legal and governance aspects are developed with water and hydrosystems as highlighted theme.

The analysis of ecosystems comes within the broader context of sustainable management and aims at understanding the natural and semi-natural ecosystems functioning under the pressure of global changes.
