

# Master of science in Civil Engineering

## Focus Professional

The programme aims at developing general skills for civil engineering applications, including the design and structural mechanics aspects, the mastering of geomaterials, project management skills, or integrated water resources management.

To reach these objectives, the MA programme is centered on the design methodology. Acquiring the required technological skills is based on the scientific knowledge and competencies developed during the BA.

Among the main axes of the programme, an emphasis is put on the simulation tools for structures and materials, which allow modelling physical reality by state of the art models treated mathematically or computationally.

Geotechnical and environmental aspects also require specific approaches for natural materials (soils, rocks) that have to be dealt with in any construction project.

The courses, exercises and lab sessions are complemented with many projects and a Master Thesis. Three options (three modules) are available in MA2: structures, construction and geomaterials, water resources.
