

Master of science in Physical Engineering

Focus Professional

The Physics Engineering curriculum is ideally started from the third year of the bachelor degree, with an optional course module in physics. The latter consists in mathematics, numerical analysis and quantum physics courses, complementary to the ones of the first two years. This module also introduces solid-state, semiconductor and optics physics lectures. The Physics Engineering master is however accessible to engineering bachelors with other orientations.

The Master curriculum itself consists in a first mandatory year, with teaching modules in applied mathematics, microscopic physics, physical and nuclear engineering. Students also have to choose a technical project taking place outside the University, possibly as an internship or in development aid. The second year first consists in a master thesis. This in-depth introduction to scientific or technical research can be conducted either inside the École polytechnique or outside (industry, research centre, other faculty or university...). In parallel with this thesis, a minimum of one module and 23 credits of specialised lectures have to be chosen among the five specialised modules in quantum technologies, photonics, mathematical modeling of systems, nuclear engineering and medical radiophysics. They can in particular be chosen in other Master degrees of the École polytechnique or in the fundamental physics department.

A 3-month internship can also be achieved, possibly coupled to the master thesis, as well as a team-leader project.
